(1)MSC means the maximum current during start up of the compressor |

(2)Select wire size based on the value of MCA |

Heating: indoor temp. 20°CDB; outdoor temp. 7°CDB, 6°CWB; equivalent refrigerant piping: 5m; level difference: 0m |

Sound values are measured in a semi-anechoic room. |

Sound power level is an absolute value that a sound source generates. |

Sound pressure level is a relative value, depending on the distance and acoustic environment. For more details, please refer to the sound level drawings. |

MFA is used to select the circuit breaker and the ground fault circuit interrupter (earth leakage circuit breaker). |

Maximum allowable voltage range variation between phases is 2%. |

RLA is based on following conditions: indoor temp. 27°CDB, 19°CWB; outdoor temp. 35°CDB |

TOCA means the total value of each OC set. |

Contains fluorinated greenhouse gases |

Voltage range: units are suitable for use on electrical systems where voltage supplied to unit terminal is not below or above listed range limits. |

FLA means the full load amps of the fan motor. |

In accordance with EN/IEC 61000-3-11, respectively EN/IEC 61000-3-12, it may be necessary to consult the distribution network operator to ensure that the equipment is connected only to a supply with Zsys ≤

Zmax, respectively Ssc ≥ minimum Ssc value. |

EN/IEC 61000-3-11: European/international technical standard setting the limits for voltage changes, voltage fluctuations and flicker in public low-voltage supply systems for equipment with rated ≤ 75A |

EN/IEC 61000-3-12: European/international technical standard setting the limits for harmonic currents produced by equipment connected to public low-voltage system with input current > 16A and ≤ 75A per phase |

Short-circuit power |

system impedance |

Cooling: indoor temp. 27°CDB, 19.0°CWB; outdoor temp. 35°CDB; equivalent piping length: 5m; level difference: 0m

5 Capacity tables

5 - 3 Integrated Heating Capacity Correction Factor

ERQ-AW1

Integrated heating capacity coefficient

The heating capacity tables do not take account of the reduction in capacity, when frost has accumulated or while the defrosting operation is in progress. The capacity values, which take these factors into account, in other words, the integrated heating capacity values, can be calculated as follows

Formula:

Integrated heating capacity = A

Value given in table of capacity characteristics = B

Integrating correction factor for frost accumulation (kW) = C

$A = B \times C$

Correction factor for finding integrated heating capacity

Inlet port temperature of heat exchanger (°C/RH 85%)	-7	-5	-3	0	3	5	7
Integrating correction factor for frost accumulation	0,96	0,93	0,87	0,81	0,83	0,89	1,0

Note:

1. The figures shows that the integrated heating capacity expresses the integrated capacity for a single cycle (from defrost operation to defrost operation) in terms of time.

Please note that, when there is an accumulation of snow against the outside surface of the outdoor unit heat exchanger, there will always be a temporary reduction in capacity, although this will of course vary in degree in accordance with a number of other factors, such as the outdoor temperature (°CDB), relative humidity (RH) and the amount of frosting which occurs.

Correction factor for piping length (α) Cooling

Correction factor for piping length (α) Heating

Explanation of symbols:

Hp: Level difference between air handling unit and outdoor unit when air handling unit is installed below the outdoor unit
Hm: Level difference between air handling unit and outdoor unit when air handling unit is installed above the outdoor unit
L: Equivalent piping length (m)
α: Capacity correction factor

Diameter of pipes:

Outdoor unit class	Gas	Liquid
125	φ 15.9	φ 9.5
200	φ 19.1	φ 9.5
250	φ 22.2	φ 9.5

Notes:

- These figures illustrate the correction factor for piping length of the system at maximum load under standard conditions.
Under partial load conditions there is only minor deviation from the correction factor shown in the figures above.
- Method of calculating cooling capacity (max. capacity)
Cooling capacity = Cooling capacity obtained from the cooling capacity characteristics table X Capacity correction factor
- Method of calculating heating capacity (max. capacity)
Heating capacity = Heating capacity obtained from the heating capacity characteristics table X Capacity correction factor

- 1 All wiring, components and materials to be produced on the site must comply with the applicable local and national codes.
- 2 Use copper conductors only.
- 3 For more details, see wiring diagram.
- 4 Install a circuit breaker for safety.
- 5 All field wiring and components must be installed by a licensed electrician.
- 6 All field wiring and components must be provided by a licensed electrician and must comply with the relevant local and national codes.
- 7 Wiring shown are general points-of-connection guides only and are not intended for or to include all details for a specific installation.
- 8 Be sure to install the switch and the fuse to the power line of each equipment.
- 9 Install the main switch that can interrupt all power sources in an integrated manner because this system consists of the equipment utilizing the multiple power sources.
- 10 If there exists the possibility of reversed phase, lose phase, momentary blackout or the power goes on and off while the product is operating, attach a reversed phase protection circuit locally.
- 11 For detailed control box side connection, see control box manual and wiring diagram.

NOTES

- 1 The operating sound is measured in anechoic chamber, if it is measured under the actual installation conditions, it is normally over the set value due to environmental noise and sound reflection.

12 Installation

ERQ-AW1B

For single unit installation

For installation in rows

For centralized group layout

<Unit: mm>

NOTES

- Heights of walls in case of Patterns 1 and 2:
Front: 1500mm
Suction side: 500mm
Side: Height unrestricted.
Installation space to be shown in this drawing is based on the cooling operation at 35 degrees outdoor air temperature.
When the design outdoor air temperature exceeds 35 degrees or the load exceeds maximum ability because of much generation load of heat in all outdoor unit, take the suction side space more broadly than the space to be shown in this drawing.
- If the above wall heights are exceeded then $h/2$ and $h/2$ should be added to the front and suction side service spaces respectively as shown in the figure on the right.
- When installing the units most appropriate pattern should be selected from those shown above in order to obtain the best fit in the space available always bearing in mind the need to leave enough space for a person to pass between units and wall and for the air to circulate freely. (If more units are to be installed than are catered for in the above patterns your layout should take account of the possibility of short circuits.)
- The units should be installed to leave sufficient space at the front for the on site refrigerant piping work to be carried out comfortably.

NOTES

- 1 The proportions of cement: sand: gravel for the concrete shall be 1:2:4, and the reinforcement bars that their diameter are 10mm, (approx. 300mm intervals) shall be placed.
- 2 The surface shall be finished with mortar. The corner edges shall be chamfered.
- 3 When the foundation is built on a concrete floor, rubble is not necessary. However, the surface of the section on which the foundation is built shall have rough finish.
- 4 A drain ditch shall be made around the foundation to thoroughly drain water from the equipment installation area.
- 5 When installing the equipment on a roof, the floor strength shall be checked, and water-proofing measures shall be taken.
- 6 Y Ditch is not necessary for 125 models.

NOTES

- These figures assume the following operating conditions.
Indoor and outdoor units:
 - Equivalent piping length 7.5m
 - Level difference 0m
- Depending on operation and installation conditions, the indoor unit can change over to freeze-up operation (indoor de-icing).
- To reduce the freeze-up operation (indoor de-icing) frequency it is recommended to install the outdoor unit in a location not exposed to wind.
